kolortrim...

...a unique life line for all professional installers!

To colour coat any product correctly is a technique within itself. With years of investment of time, money and training given to perfecting this technique. The results show in the quality of our product.

Special paint is applied using the latest equipment and technology, which physically and chemically bonds to the substrate becoming part of the surface of the material.

This dries quickly, as a smooth finish that forms an extra protective coating that never needs re-painting. It doesn't peel, crack or flake, and is guaranteed weatherproof for 10 years.

There are no shortcuts, the finish should be flat and free of any dust or inclusions. When applied to a foiled surface it should adhere to every contour. With attention to detail being paramount, we ensure every component is correctly colour coated to make a perfect match.

All colour coating is:

- Guaranteed for 10 years
- UV stable most colours 4-5 on the grey scale
- Self etching – permanently bonds to the surface
- Totally flexible – bends with the material to which it is bonded
- Available in satin, semi gloss, full gloss
- Available in any colour including metallic
